

I am

Air pollution is one of environmental issues that cannot be ignored. Inhaling pollutants for a long time causes damages in human health

I'm trying to

Traditional air quality monitoring methods, such as building air quality monitoring stations, are typically expensive

But

This project is suitable for air quality monitoring in real time

Because

Design a tool which will sense quality of air and display it in the form of percentage

Which makes me feel

Sense how much carbon mono-oxide(CO) is present in air and display in the form of percentage, Sense the temperature and display it in degree celciu

miro
